

Feature: User authentication by a Google Account

Currently is very common in modern applications to authenticate using an account offered by some known company like Google, Microsoft and LinkedIn. The reason for that is security and convenience.

Using a Google Account for example, a user can access some other application using the same credentials without share

your sensitive data with this applications. This way the user can centralize the sensitive data in one place and use

then in some other services. The technology responsible for that is OAuth2 that is a industry-standard protocol.

User Story:

As a user, I want to log-in using a Google Account so that I don't need to register a new username and password and I can also manage my access in just one place.
